

0.0.0 Solving Problems With Dumb! Computer?

Three Steps:

- 1. Model the problem
 - > Clean off, get the core
 - > setting up notations for formulation
- 2. Search, find or design an algorithm
 - > just idea (pseudo code)
 - > Analyze it how long?
 - > Prove it correct works?
- 3. Develop the solution
 - > What data structure to use?
 - > How to make it efficient?
 - Coding (finally, piece of cake)

1.1 A First Problem: Stable Matching

Matching Residents to Hospitals

Goal. Given a set of preferences among hospitals and medical school students, design a self-reinforcing admissions process.

Unstable pair: applicant x and hospital y are unstable if:

- x prefers y to its assigned hospital.
- y prefers x to one of its admitted students.

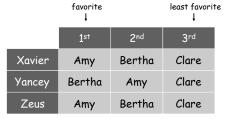

Stable assignment. Assignment with no unstable pairs.

- Natural and desirable condition.
- Individual self-interest will prevent any applicant/hospital deal from being made.

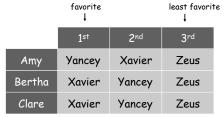

Stable Matching Problem

Goal. Given n men and n women, find a "suitable" matching.

- Participants rate members of opposite sex.
- Each man lists women in order of preference from best to worst.
- Each woman lists men in order of preference from best to worst.

Men's Preference Profile

Women's Preference Profile

Stable Matching Problem

Perfect matching: everyone is matched monogamously.

- Each man gets exactly one woman.
- Each woman gets exactly one man.

Stability: no incentive for some pair of participants to undermine assignment by joint action.

- In matching M, an unmatched pair m-w is unstable if man m and woman w prefer each other to current partners.
- Unstable pair m-w could each improve by eloping.

Stable matching: perfect matching with no unstable pairs.

Stable matching problem. Given the preference lists of n men and n women, find a stable matching if one exists.

Bob	С	Α	D
Chris	Α	В	D
Doofus	Α	В	С

12

Stable Roommate Problem

Q. Do stable matchings always exist?

Stable roommate problem.

- 2n people; each person ranks others from 1 to 2n-1.
- Assign roommate pairs so that no unstable pairs.

	1 ^{s†}	2 nd	3 rd
Adam	В	С	D
Bob	С	Α	D
Chris	Α	В	D
Doofus	Α	В	С

 $\begin{array}{lll} \text{A-B, C-D} & \Rightarrow & \text{B-C unstable} \\ \text{A-C, B-D} & \Rightarrow & \text{A-B unstable} \\ \text{A-D, B-$C} & \Rightarrow & \text{A-C unstable} \end{array}$

Stable Roommate Problem

- Q. Do stable matchings always exist?
- A. Not obvious a priori.

Stable roommate problem.

- 2n people; each person ranks others from 1 to 2n-1.
- Assign roommate pairs so that no unstable pairs.

	1 st	2 nd	3 rd
Adam	В	С	D
Bob	С	Α	D
Chris	Α	В	D
Doofus	Α	В	С

 $\begin{array}{lll} \text{A-B, C-D} & \Rightarrow & \text{B-C unstable} \\ \text{A-C, B-D} & \Rightarrow & \text{A-B unstable} \\ \text{A-D, B-$C} & \Rightarrow & \text{A-C unstable} \end{array}$

Observation. Stable matchings do not always exist for stable roommate problem.

14

Propose-And-Reject Algorithm

Propose-and-reject algorithm. [Gale-Shapley 1962] Intuitive method that guarantees to find a stable matching.

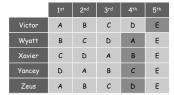

```
Initialize each person to be free.
while (some man is free and hasn't proposed to every woman) {
   Choose such a man m
   w = 1<sup>st</sup> woman on m's list to whom m has not yet proposed
   if (w is free)
        assign m and w to be engaged
   else if (w prefers m to her fiancé m')
        assign m and w to be engaged, and m' to be free
   else
        w rejects m
}
```

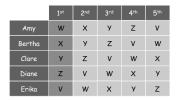

Proof of Correctness: Termination

Observation 1. Men propose to women in decreasing order of preference.

Observation 2. Once a woman is matched, she never becomes unmatched; she only "trades up."

Claim. Algorithm terminates after at most n^2 iterations of while loop. Pf. Each time through the while loop a man proposes to a new woman. There are only n^2 possible proposals.

n(n-1) + 1 proposals required

17

Proof of Correctness: Perfection

Claim. All men and women get matched.

Pf. (by contradiction)

 Suppose, for sake of contradiction, that Zeus is not matched upon termination of algorithm.

Proof of Correctness: Perfection

Claim. All men and women get matched.

Pf. (by contradiction)

- Suppose, for sake of contradiction, that Zeus is not matched upon termination of algorithm.
- Then some woman, say Amy, is not matched upon termination.
- By Observation 2, Amy was never proposed to.
- But, Zeus proposes to everyone, since he ends up unmatched. •

19

Proof of Correctness: Stability

Claim. No unstable pairs.

Pf. (by contradiction)

- Suppose A-Z is an unstable pair: each prefers each other to partner in Gale-Shapley matching S*.
- Case 1: Z never proposed to A.

S*
Amy-Yancey
Bertha-Zeus

• Case 2: Z proposed to A.

■ In either case A-Z is stable, a contradiction. •

Proof of Correctness: Stability

Claim. No unstable pairs.

Pf. (by contradiction)

■ Suppose A-Z is an unstable pair: each prefers each other to partner in Gale-Shapley matching S*.

men propose in decreasing order of preference Case 1: Z never proposed to A.

5*

- \Rightarrow Z prefers his GS partner to A.
- \Rightarrow A-Z is stable.

Amy-Yancey Bertha-Zeus

. . .

- Case 2: Z proposed to A.
 - ⇒ A rejected Z (right away or later)
 - \Rightarrow A prefers her GS partner to Z. \leftarrow women only trade up
 - \Rightarrow A-Z is stable.
- In either case A-Z is stable, a contradiction. •

Summary

Stable matching problem. Given n men and n women, and their preferences, find a stable matching if one exists.

Gale-Shapley algorithm. Guarantees to find a stable matching for any problem instance.

- Q. How to implement GS algorithm efficiently?
- Q. If there are multiple stable matchings, which one does GS find?

Efficient Implementation

Efficient implementation. We describe $O(n^2)$ time implementation.

Representing men and women.

- Assume men are named 1, ..., n.
- Assume women are named 1', ..., n'.

Engagements.

- Maintain a list of free men, e.g., in a queue.
- Maintain two arrays wife[m], and husband[w].
 - set entry to 0 if unmatched
 - if m matched to w then wife[m]=w and husband[w]=m

Men proposing.

- For each man, maintain a list of women, ordered by preference.
- \blacksquare Maintain an array <code>count[m]</code> that counts the number of proposals made by man <code>m</code>.

23

Efficient Implementation

Women rejecting/accepting.

- \blacksquare Does woman w prefer man m to man m ?
- For each woman, create inverse of preference list of men.
- Constant time access for each query after O(n) preprocessing.

Amy	1 st	2 nd	3 rd	4 th	5 th	6 th	7 th	8 th
Pref	8	3	7	1	4	5	6	2
4.	4	2	_	4	F	,	7	0
Amy	1	2	3	4	5	6	7	8

for i = 1 to n
 inverse[pref[i]] = i

Amy prefers man 3 to 6 since inverse[3] < inverse[6] 2 7

Understanding the Solution

Q. For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?

An instance with two stable matchings.

- A-X, B-Y, C-Z.
- A-Y, B-X, C-Z.

	1 ^{s†}	2 nd	3 rd
Xavier	Α	В	С
Yancey	В	Α	С

Clare	X	У	Z

25

Understanding the Solution

Q. For a given problem instance, there may be several stable matchings. Do all executions of Gale-Shapley yield the same stable matching? If so, which one?

Def. Man m is a valid partner of woman w if there exists some stable matching in which they are matched.

Man-optimal assignment. Each man receives best valid partner.

Claim. All executions of GS yield man-optimal assignment, which is a stable matching!

- No reason a priori to believe that man-optimal assignment is perfect, let alone stable.
- Simultaneously best for each and every man.

Man Optimality

Claim. GS matching S* is man-optimal.

Pf. (by contradiction)

- Suppose some man is paired with someone other than best partner. Men propose in decreasing order of preference ⇒ some man is rejected by valid partner.
- Let Y be first such man, and let A be first valid woman that rejects him.

Bertha-Zeus Let S be a stable matching where A and Y are matched.

- When Y is rejected, A forms (or reaffirms) engagement with a man, say Z, whom she prefers to Y.
- Let B be Z's partner in S.
- Z not rejected by any valid partner at the point when Y is rejected by A. Thus, Z prefers A to B.
- But A prefers Z to Y.

■ Thus A-Z is unstable in S. •

since this is first rejection by a valid partner

Amy-Yancey

Stable Matching Summary

Stable matching problem. Given preference profiles of n men and n women, find a stable matching.

> no man and woman prefer to be with each other than assigned partner

Gale-Shapley algorithm. Finds a stable matching in O(n2) time.

Man-optimality. In version of GS where men propose, each man receives best valid partner.

> w is a valid partner of m if there exist some stable matching where m and w are paired

Q. Does man-optimality come at the expense of the women?

Woman Pessimality

Woman-pessimal assignment. Each woman receives worst valid partner.

Claim. GS finds woman-pessimal stable matching S*.

Pf.

- Suppose A-Z matched in S*, but Z is not worst valid partner for A.
- There exists stable matching S in which A is paired with a man, say Y, whom she likes less than Z.
- Let B be Z's partner in S.
- Z prefers A to B. ← man-optimality
- Thus, A-Z is an unstable in S. •

Amy-Yancey Bertha-Zeus

Lessons Learned

Powerful ideas learned in course.

- Isolate underlying structure of problem.
- Create useful and efficient algorithms.

Potentially deep social ramifications. [legal disclaimer]

Weighted Interval Scheduling

Input. Set of n jobs, each job i has start time s_i and finish time f_i . and weight w_i .

Goal. Find maximum weight subset of mutually compatible jobs.
